- **Status:** Active

Project Description: OpenSS7 to provide a robust and GPL'ed SS7, SIGTRAN, ISDN and VoIP stack for Linux and other UN*X operating systems.

Further info:

OpenSS7 is in the production stage on a number of significant components. Other components are in the Beta or Alpha stage. Some components remain unsuitable for public release. What we have done is made the source code available for those that are interested in following the development or in pushing the envelope on our development. Even though a number of components are production stable, *load this code and mess with it at your own peril*. There is still a possibility that the code will crash your machine and cause you to have to reboot. You might irreparably damage your header files and be unable to recompile your kernel. You may have to reload your system. There is no warranty.
